

Oracle Content Management Migration Scenarios

For OCM there are two standard migration approaches:

1. Adhoc migration solution based OCM Capture

- Files can metadata can be migrated to a folder that capture is monitoring

2. Large scale migration solution based on exporting files to object storage and providing CSV file that describes the metadata

Phase 1

Get all the files exported into Object Storage

- WebCenter Content has an object storage file provider which can be used to get all files moved.

Phase 2

Using a CSV file (one row per file being migrated which has column for each metadata field and pointer to files stored in object storage) we implement a bulk transformation at the database layer (Imported files to OCM assets)

- This approach can scale to efficiently migrate millions of documents from WebCenter Content or other 3rd party legacy content silos
